## **EXAMINER'S STATEMENT OF REASONS FOR ALLOWANCE**

### ***Information Disclosure Statement***

The IDS filed on 3/10/04 has been acknowledged and a signed copy of the PTO-1449 is attached herein.

### ***Allowable Subject Matter***

Claims 1-24 are allowed.

The following is an examiner's statement of reasons for allowance: the cited prior art of record does not teach or fairly suggest a system for imaging an airfoil within a combustion turbine engine and corresponding method comprising, along with the other claimed features, a radial positioner disposing an image receptor within an inner turbine casing at a first position for acquiring a first image and at a second position for acquiring a second image and a processor to generate a composite image from the first and second images.

The cited prior art of record teaches various turbine engine inspection methods, primarily using borescopes and endoscopes that enable a user to see inside the engine while it is in operation mode. Some configurations teach using a video camera to view the inside of the turbine casing remotely. One reference in particular, Devitt et al. (U.S. 2005/0073673), teaches using two cameras: one has a wide-angle lens that allows an overview image, the other has a narrow field of view to provide detailed views of smaller areas. There is no teaching or suggestion, however, to use an imaging device to take first and second images at respectively different positions within the turbine casing and subsequently providing a composite image from said first and second images.

Art Unit: 2878

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

### ***Conclusion***

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure because they teach various turbine engine inspection configurations comprising some form of imaging device to view the inside of the turbine casing while the engine is in operation mode.
